Domain Setup Guide

Flames of Passion Entertainment

Prepared by: Marceau Solutions **Date:** March 2026

What This Guide Does

This guide walks you through three things:

1. **Transferring your domain from Squarespace to Cloudflare** — saves you money every year
2. **Cancelling your Squarespace account entirely** — no more monthly or annual charges
3. **Setting up your domain to point to your website** — which is already built and hosted for free

Why Transfer?

Your website is already live and hosted for free through GitHub Pages. You don't need Squarespace at all. By transferring your domain to Cloudflare, you'll pay about **$10/year** instead of $20-40/year on Squarespace — and Cloudflare never marks up domain prices.

PART 1: Transfer Your Domain to Cloudflare

Step 1: Create a Free Cloudflare Account

1. Go to **cloudflare.com**
2. Click **Sign Up** (top right)
3. Enter your email and create a password
4. Verify your email address

Step 2: Add Your Domain to Cloudflare

1. Once logged in, click **Add a site** (or **+ Add site**)
2. Type in your domain name (e.g., `flamesofpassionentertainment.com`)
3. Click **Continue**
4. Select the **Free** plan and click **Continue**
5. Cloudflare will scan your existing DNS records — click **Continue** (we'll set up the correct records later)

6. Cloudflare will show you two **nameservers** — write these down or keep this page open (you'll need them in Step 4)

Step 3: Unlock Your Domain on Squarespace

1. Go to **squarespace.com** and log in
2. Click your **profile icon** (top right) and select **Domains**
3. Click on your domain name
4. Click **Transfer** (or look in Settings/Advanced for transfer options)
5. **Turn off the domain lock** — look for "Domain Lock" or "Transfer Lock" and toggle it OFF
6. **Get your transfer authorization code** (also called an EPP code or Auth code) — Squarespace should show it on this page or email it to you
7. Copy this code somewhere safe — you'll need it in the next step

Step 4: Start the Transfer on Cloudflare

1. Go back to **cloudflare.com** and log in
2. Click on your domain
3. In the left sidebar, click **Registrar** then **Transfer**
4. Click **Transfer** next to your domain
5. Paste the **authorization code** from Squarespace
6. Enter your payment info — you'll pay about **$10** for one year of registration
7. Click **Confirm Transfer**

Step 5: Approve the Transfer

- You'll get an email from Squarespace asking you to confirm the transfer
- **Approve it** — this speeds things up
- The transfer usually completes within **1-5 days**
- You'll get an email from Cloudflare when it's done

Step 6: Cancel Squarespace Entirely

Once the domain transfer is complete (you'll get a confirmation email from Cloudflare):

1. Go to **squarespace.com** and log in
2. Cancel any website subscription if you have one:
   - Go to **Settings** > **Account & Billing** > **Billing**
   - Click **Cancel Subscription**
3. Once the domain is fully transferred out, you can close your Squarespace account if you want

---

PART 2: Set Up Your DNS Records on Cloudflare

Once your domain transfer is complete, set up these records so your domain points to your website.

Step 7: Go to DNS Settings

1. Log in to **cloudflare.com**
2. Click on your domain
3. In the left sidebar, click **DNS** then **Records**

Step 8: Add the 4 A Records

Click **Add Record** for each of these. Set the type to **A**.

Important: For each record, click the **orange cloud icon** to turn it **gray** (DNS only). This keeps things simple.

Type	Name	Content (copy exactly)	Proxy
A	`@`	`185.199.108.153`	DNS only (gray cloud)
A	`@`	`185.199.109.153`	DNS only (gray cloud)
A	`@`	`185.199.110.153`	DNS only (gray cloud)
A	`@`	`185.199.111.153`	DNS only (gray cloud)

Step 9: Add the CNAME Record

Click **Add Record** one more time:

Type	Name	Content (copy exactly)	Proxy
CNAME	`www`	`marceausolutions.github.io`	DNS only (gray cloud)

Step 10: Remove Any Old Records

If you see any A records pointing to IP addresses other than the four listed above, delete them by clicking the **X** or trash icon.

Keep any MX or TXT records (those are for email).

Step 11: Verify Your Records

Your DNS page should now show:

Type	Name	Content
A	@	185.199.108.153
A	@	185.199.109.153
A	@	185.199.110.153
A	@	185.199.111.153
CNAME	www	marceausolutions.github.io

PART 3: Test Your Website

Step 12: Wait for DNS to Propagate

- **Usually:** 15–30 minutes
- **Worst case:** Up to 48 hours (rare, especially with a fresh transfer)

Step 13: Test Your Domain

1. Open a browser in incognito/private mode
2. Type in your domain name
3. You should see your Flames of Passion website!
4. Also try with `www.` in front

If it's not working:

- Double-check the IP addresses for typos
- Make sure the cloud icons are gray (not orange)
- Make sure old A records are deleted
- Try clearing your browser cache
- It can take up to 48 hours after a domain transfer

Step 14: Text Me When It's Working!

Once you see your website on your domain, text me so I can:

- Turn on HTTPS (the padlock icon)
- Make sure everything looks perfect
- Set up anything else you need

Need Help?

If you get stuck at any point, just text or call:

Quick Reference — All Values

What	Value
A Record IP #1	`185.199.108.153`
A Record IP #2	`185.199.109.153`
A Record IP #3	`185.199.110.153`
A Record IP #4	`185.199.111.153`
CNAME Host	`www`
CNAME Points To	`marceausolutions.github.io`
Recommended Registrar	Cloudflare (~$10/year)
